Acknowledgements

I sincerely thank ADAP Geneva for entrusting me with vegetation survey in Mulele Hills FR. I am very grateful to the Katavi-Ugalla corridor project supervisor, Twinzi Henrico for his great support for conducting successfully this mission and to the livelihood and natural resources officer from the Rungwa corridor project, Matana Levi, for his commitment and advice.

Particular thanks go to Fredy Masanja, DFO Sikonge district, for completing successfully the transects after my departure and to Paulo Rugola Benedicto and Emmanuel Safari, both TFS forester at Mlele district, for their professional support. I want to express my sincerest thanks to the Village Game Scouts Bernard Lyamba from Mgombe and Feleciano Futakamba from Kaulolo for their great support and guidance in the field. Special thanks go to Yahya Ally, project driver, for his logistical support. I also extend my warmest thanks to my son Alex Bloesch for his commitment and his very active participation in the fieldwork. The field work would not have been possible without the tireless commitment of all team members.

My special thanks go to Thomas Wambura, acting TFS zonal manager western Tanzania, for his advice and for supporting the mission and to Misango Makaranga, Game Warden Rukwa Game Reserve at the Training Centre, for his hospitality.

Abstract

The vegetation survey was carried out in July and November 2021 in Mulele Hills Forest Reserve of Mlele District in Western Tanzania. The objective of the survey was to assess the current state of the vegetation and its current threats to establish a baseline for the management and monitoring of the area.

A transect method based on the Point-Centered Quarter Method (PCQM), a plotless method, was applied for the assessment of a) tree/shrub species richness and density at stand level and b) diameter class distribution, absolute frequency, basal area and dominance at species level. In addition, the human disturbances were recorded along the transects.

In total three transects with an overall length of 22.777 km were outlined in Mulele Hills Forest Reserve including western lowland, plateau, and eastern lowland (Mulele Beekeeping Zone was surveyed in 2018, see Bloesch 2019). In total 86 sampling points were analysed including 291 trees of the larger diameter class (≥ 20 cm) and 334 trees/shrubs of the lower diameter class (< 20 cm) considering quarters with no trees.

Julbernardia globiflora a characteristic, widespread and often dominating species of many miombo woodlands, is also very abundant on the plateau and the eastern lowlands of Mulele Hills FR. On the other hand, *Julbernardia globiflora* is quasi absent in the open and extensively flooded western lowlands. *Brachystegia spiciformis*, another typical miombo species, is also in Mulele Hills FR a common tree of the upper layer. Another abundant species in both layers is *Erythrophleum africanum*.

The understoreys are widely dominated by *Diplorhynchus condylocarpon* followed by *Pseudolachnostylis maprouneifolia*. The low abundance of saplings in general is probably typical for miombo trees where natural regeneration is poor and sparsely because of poor seedling survival during establishment mainly due to recurrent fires and browsing.

Pterocarpus angolensis produces one of the best timbers in East Africa and due to overexploitation mature stems become very rare and is considered as near threatened according to the IUCN Red List. Fortunately, *Pterocarpus angolensis* is amongst the most abundant tree species of the lower diameter class in Mulele Hills FR. It would be interesting to analyse the diameter class distribution for other timber species which are now increasingly used as timber but our data are too sparse.

The alpha-diversity for trees and shrubs assessed for Mulele Hills FR is with 46 and 70 species in the larger and lower size diameter class, respectively, considerably higher than in Kululu Village Land FR (27/47) and Rungwa River FR (29/40). This high biodiversity for Mulele Hills FR is probably due to the diverse landscapes assessed by the three transects.

The vegetation surveys from Mlele Beekeeping Zone, Kululu Village Land FR and Rungwa River FR and this survey from Mulele Hills FR resulted in a quite comprehensive plant list including a total of 175 trees/shrubs identified with their scientific and vernacular names. This plant list will be very useful for any future forest management in the area, the elaboration of a vegetation map, and for the assessment of the importance of the non-timber forest products for the livelihoods of the adjacent local communities.

Tree density in both diameter classes is significantly lower in the extensively flooded western lowlands. Consequently the total standing volume is with 69.9 m^3 and 64.4 m^3 on the plateau and eastern lowland, respectively, about twice as high as in the western lowlands. The

dense woodlands on the plateau and eastern lowland of Mulele Hills FR have the highest standing volume of all surveyed protected areas.

Timber logging is the prevailing human ecosystem disturbance. Debarking of *Jubbernardia globiflora* for producing beehives is still very common in the eastern woodlands close to Inyonga.

Detailed vegetation maps showing the different vegetation types and land use in the project areas would be a very useful for management and monitoring purposes. Such maps would also allow the spatial stratification of the project area with well-defined units which could support other studies in future.

New team members were trained on-the-spot and have now a good understanding of the different steps of the methodology. For future vegetation transect surveys it is suggested to associate Village Game Scouts (VGS) who are not yet trained and members from the Village Natural Resource Committee to explain them the importance of baseline data and regular monitoring of the state of the forest for management purposes. The human disturbances should be recorded every two years by the VGSs along the same transects to monitor the threats for the miombo ecosystems.

The comprehensive vegetation data (especially standing volume) of the miombo woodlands of Kululu Village Land FR, Rungwa River FR and Mulele Hills FR are a solid base for developing and implementing a carbon project.

1) Introduction

The Association for the Development of Protected Areas (ADAP) is implementing the projects entitled *Community forest management of the Rungwa respectively Katavi-Ugalla corridor* in Tabora and Katavi regions in western Tanzania. The projects aim to support and accompany villages bordering Rungwa River and Mulele Hills Forest Reserves (FRs) in establishing a Joint Forest Management (JFM) for the protected areas with the Tanzania Forest Service Agency (TFS). More recently, ADAP started a third project entitled *Sustainable Management of the Ipole Wildlife Management Area* in Sikonge District, Tabora region.

The projects aim to ensure the conservation of the ecological corridors (Ushoroba) by closely involving the local communities in the forest management through forest protection and patrol. In return for these efforts, the participating villages receive a range of concrete benefits, such as rights to harvest forest products, share revenue from forest harvesting, retain fines as well as confiscated materials/produce, and use of local water sources (Forestry and Beekeeping Division 2007, 2013).

Sustainable community-based forest management will improve the livelihoods of the locals through the development of income generating activities such as beekeeping and promoting and selling of wild edible mushrooms thereby inciting the local population for the conservation of the miombo ecosystems.

Knowing the current state and threats of a forest ecosystem (baseline) is a prerequisite for any sustainable management. So far, Adansonia-Consulting carried out two vegetation studies for ADAP using the transect method including the Point-Centered Quarter Method (PCQM) and the assessment of human disturbances along the transects. The first survey was carried out in in Mlele Beekeeping Zone (BKZ) covering 850 km² within Mulele Hills FR of the Katavi-Ugalla Corridor (Bloesch 2019), while the second was conducted in Rungwa River Forest Reserve (FR) and Kululu Village Land FR of the Rungwa Corridor (Bloesch 2020, 2022).

For this third survey, Adansonia-Consulting was mandated with the following tasks:

Assess the current state (baseline) of the vegetation of the Mulele Hills FR (outside the BKZ) and its current threats:

- Assess the following forest parameters along transects using the PCQM method (Mueller-Dombois, & Ellenberg 1974, Mitchell 2007):
 - Tree/shrub species richness at stand level;
 - Tree/shrub density at stand level;
 - For each tree species its diameter class diameter distribution;
 - Absolute frequency of each tree species;
 - Basal area and dominance of each tree species.
- Record all human ecosystem disturbances along the transects.

The consultancy was conducted from 27 June to 14 July 2021 in Tanzania (see mission programme Annexe A). The field team was composed of:

Dr. Urs Bloesch, team leader;

Matana Levi, ADAP livelihood and natural resources officer from Rungwa Corridor project;

Fredy Masanja, District Forest Officer (DFO) Sikonge district;

Paulo Rugola Benedicto, TFS forest officer Mlele District;

Emmanuel Safari, TFS forest officer Mlele District;

Bernard Lyamba, VGS from Mgombe;

Feleciano Futakamba, VGS from Kaulolo;
Yahya Ally, ADAP project driver;
Alex Bloesch, student apprentice.

Later on, the three transects in Mulele Hills FR were completed by Fredy Masanja and his team (8 to 10 November 2021) to obtain finally 30 sampling points for each transect (see Appendix D).

Moreover, a joint forest inventory workshop was organised by ADAP-TFS in Tabora on 30 June 2021 (see Fig. 1) which allowed to discuss the transect methodology applied by ADAP and the inventory methodology used by TFS. The ADAP transect methodology was demonstrated in the field at Pugu Simbo FR (see Fig. 2).

Fig. 1. Joint ADAP-TFS workshop in Tabora (photograph Louise Serrat).

Fig. 2. Demonstration of Bitterlich methodology at Pugu Simbo FR (photograph Louise Serrat).

In addition, ADAP informed TFS during the workshop about the development of a new value chain for wild mushrooms promoting both, the own consumption and the selling of quality mushrooms. Local communities nearby protected areas were trained for appropriate mushroom picking, transport, and preservation techniques. Market studies confirmed the high demand for quality mushrooms. The participants appreciated the common workshop.

This report presents the state of the vegetation and the human disturbances of Mulele Hills FR based on the three transects. Former surveys from the BKZ (Bloesch 2019) and the Rungwa Corridor (Bloesch 2022) will be considered in the discussion chapter.

2) Study area

Miombo woodland is the dominating vegetation type of unimodal rainfall areas in southeastern Africa (Smith & Allen 2004) and is also the most extensive vegetation type in Tanzania (Shirima et al. 2014). The extensive area of miombo woodlands plays an important role as carbon source and sink at global level. Miombo woodlands are frequently burnt and characterized by a distinct and often continuous grass layer and open to closed tree canopy.

Miombo woodlands have a low soil nutrient content, are well drained, highly leached, acidic and low in organic matter (Frost 1996). The timber and non-timber products from the

miombo woodlands are essential for the livelihoods of millions of people living inside and outside the miombo woodlands (Campbell 1996, Malaisse 1997).

Miombo woodlands are dominated by the genera *Brachystegia* and *Jubernadia* with *Brachystegia spiciformis* and *Jubernadia globiflora* as the most common tree species (Frost 1996, Campbell 1996). Usually a floristically rich “wetter miombo” of the higher rainfall areas (>1000 mm per annum) is distinguished from floristically more poor “drier miombo” (<1000 mm per annum) based on differences in climate conditions.

Mulele Hills FR was gazetted in 1953 (TFS 2014) and is located in the west of Inyonga township surrounded by a dense network of protected areas in Katavi Region (see Fig. 3). The altitude ranges from 1200 to 1500 m a.s.l. along the escarpment which crosses the protected area from northwest to southeast.

The miombo type of the study area is transitional between “drier” and “wetter” miombo with an average annual rainfall estimated to oscillate between about 1000 mm in the lowland and about 1200 mm on the mountain range (extrapolated from Inyonga climate diagram from climate-data.org 2022).

Since several years ADAP has supported a community-based management in the Beekeeping Zone (BKZ) within Mulele Hills FR to address the alarming degradation of the miombo ecosystems caused by deforestation and poaching mainly. With the new project *Co-management of the Katavi – Ugalla corridor forests* in Mulele district, ADAP has extended its support to the entire area of Mulele Hills FR of 2,350 km² (area calculated with GIS). The Katavi-Ugalla corridor project focus on Mulele Hills FR and eight bordering villages including Utende, Mgombe, Kanoge, Wachawaseme, Mtakuja, Kaulolo, Nsenkwa, Masigo (see Fig. 3). This survey will complement the vegetation study from Mulele BKZ (Bloesch 2019).

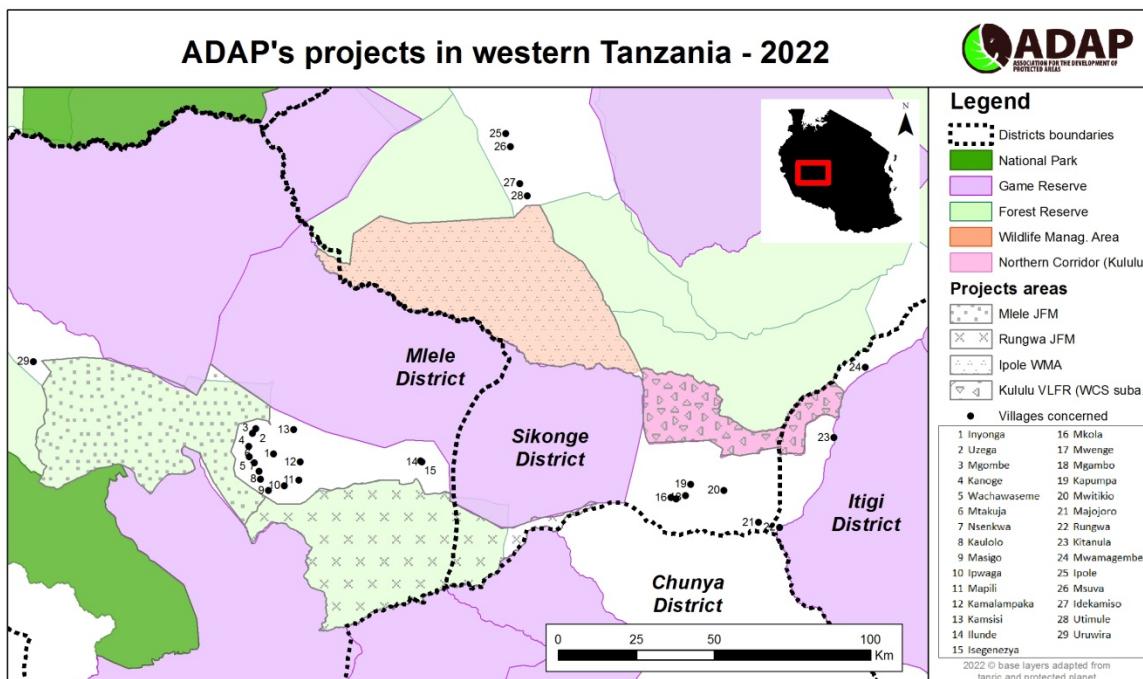

Fig. 3. ADAP Project areas in Western Tanzania.

Miombo woodlands are the predominating vegetation type in Mulele Hills FR covering more than 80% (estimated from the land use map from the Tanzania Resource Information Center, TANRIC) interspersed with many mbugas (open grasslands usually flooded during the rainy season). The seasonally waterlogged mbugas are mainly covered with grasslands and occasionally a few trees and shrubs may occur (wooded grasslands). Narrow riverine forests occur along the permanent and seasonal streams and some evergreen forest patches exist on deeper soils in depressions (south of Ngaramira area and at Masigo according to Kayombo et al. 2013).

3) Methods

3.1 Data collection

The state of vegetation and their human disturbances were assessed focussing on miombo woodlands thereby excluding larger grasslands (mbugas). The land use map from TANRIC and google earth was used to prelocate transects considering access constraints for the field survey. Finally, three transects of 30 sampling points each were outlined (see map in Appendix D) with a total transect length of 22.777 km (see Table 1).

Current state of the vegetation

Along transects a plotless method, the Point-Centered Quarter Method (PCQM), was used to assess the state of the vegetation (Mueller-Dombois, & Ellenberg 1974, Mitchell 2007). Four quarters were established at the sampling point through a right angled cross formed by two lines (sticks laid out on the ground). One line was the transect while the other running perpendicular to the transect direction through the sampling point. The distance to the midpoint at DBH of the nearest tree for two different diameter classes (see below) from the sampling point was measured in each quarter (see Fig. 4).

If a quarter had no tree within a distance of 20 m then we noted *no tree*. The interval between two sampling points has been set systematically at 300 steps measured always by the same person to avoid bias. Whenever encountered a mbuga we skipped the points in open vegetation until we reached again miombo vegetation or in the case of an extensive mbuga we relocated the transect at a parallel distance of hundred meters (if necessary adding further 50 steps, i.e. 150 steps, 200 steps...). The same principle was applied if the sampling point hit a major disturbance such as a large termite mound.

We used a handheld Garmin GPS to record the coordinates of each sampling point. All tree/shrub species and their diameter at breast height (DBH) were recorded separately for two size categories: larger trees ($DBH \geq 20$ cm) and smaller trees/shrubs ($3 \text{ cm} \geq DBH < 20$ cm) using a diameter tape measure (Richter, Germany). If a multi-stem tree was recorded in the larger diameter size class, then its stems falling under the lower diameter size class were not considered.

The heights of the dominant trees were estimated visually (ocular estimation) using a levelling rod of 2 m height as a reference at the base of a tree trunk. Slope and slope exposure were determined with a Büchi compass (P3252). Each direction of the cross marking the four quarters was systematically photographed from the sampling point (Canon powershot S95 / Xiaomi Mi 10) resulting in 208 photos taken during the first vegetation

survey¹ (see example in Fig. 5). The data for each sampling point for the three transects from Mulele Hills FR are given in Appendix B.

Fig. 4. PCQM method: Distance to the mid-point of the nearest tree from the sampling point in each quarter is measured recording tree species and diameter (photograph from Mlele BKZ survey, see Bloesch 2019).

The PCQM method allowed assessing the following forest parameters (Mueller-Dombois & Ellenberg 1974):

- Tree/shrub species richness at stand level;
- Tree/shrub density (from mean distance) at stand level;
- For each tree species its diameter class diameter distribution;
- Absolute frequency (as the occurrence of a species at the sampling points) of each tree species;
- Basal area (ba) and dominance for each species.

For comparison, the tree basal area² of the surrounding stand was also estimated in a simple but efficient way using the Bitterlich method (1948). The Bitterlich method counts

¹ All photos from the second survey conducted by Fredy Masanja have yet to be added to the database.

² Tree basal area is the cross-sectional area (over the bark) at breast height (1.3 metres above the ground) measured in square meters.

trees (shrubs) in an open circle around the sampling point using an angle-gauge. Therefore, a wooden stick of 50 cm length with a fixed small metal sheet with four angular widths at its end was used. Only trees (shrubs) stems having a DBH larger than the smallest angular width (appropriate angular width for miombo woodlands) with a counting factor of $k = 1$ were included in the count.

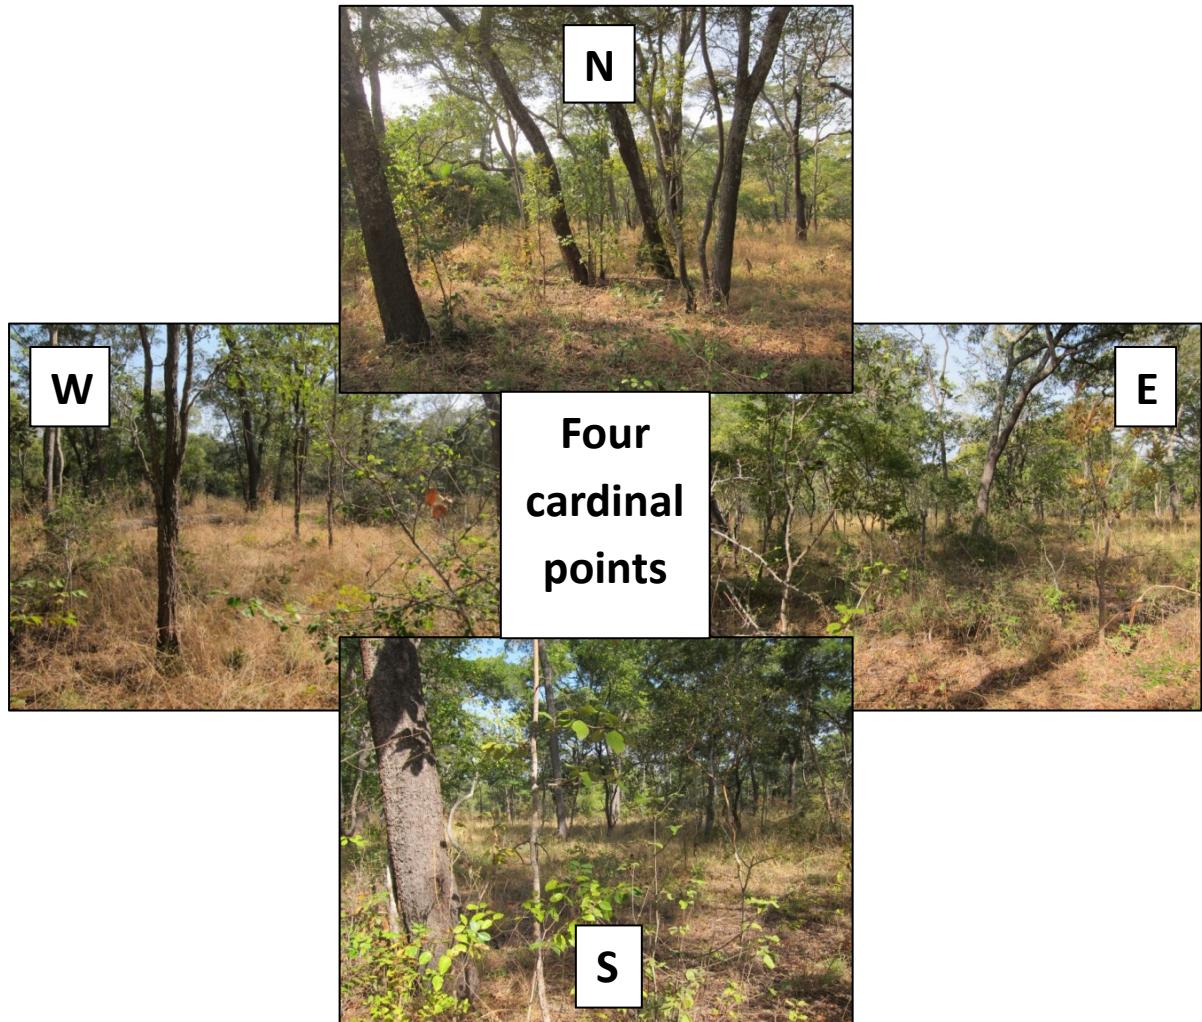

Fig. 5. Visual illustration of the site at the sampling using four photographs from the sampling point in each cardinal direction (photographs from the Mlele Beekeeping Zone survey see Bloesch 2019).

Human ecosystem disturbances

All human disturbances were recorded by two persons walking opposite and parallel to the transect keeping a distance of 20 m from the transect. Each person recorded all disturbances on his side covering a sampling width of 40 m (20 meters each on his left and right along the walking direction) resulting in a total sampling width (belt transect) of 80 m. Disturbances could include logging (saw pits, stumps), Debarking (for beehives, ropes), trapping, infrastructures (camps), encroachments, and grazing by cattle. Fire signs were not recorded since most of the miombo woodlands are burnt annually.

3.2 Data analysis

If plants could not be identified in the field with certainty, voucher specimens were collected and later identified with the support of Frank Mbago, the botanist in charge from the herbarium of the University of Dar es Salaam. The former plant check list (Bloesch 2022) has been added by the new species found during this vegetation survey (see Appendix C).

Calculation of forest parameters

Please note that sampling points in open areas (mbugas) were not considered in the analysis of miombo woodland vegetation (see Table 1).

Species richness: alpha-diversity, i.e. number of species in a given community.

Tree density: area / D^2

where D is the mean distance for all trees recorded.

The tree density/ha was corrected for transects having quarters with no tree using the correction factor (CF) from Warde & Petranka (1981). CF is defined as a function of total number of vacant quarters / total number of quarters.

Basal area: $d^2\pi / 4$

where d is the DBH.

Absolute frequency i.e., the occurrence of a species at the sampling points was calculated as follows:

(N points with species/total points) x 100

Species dominance: mean ba x number of species per ha.

4) Results

4.1 Vegation data

Length and number of sampling points per transect are given in Table 1 below (see also map in Appendix D). The last column gives the number of sampling points effectively analysed since some points hit open areas (mbugas).

Table 1: Transect characteristics in Mulele Hills FR

Transect	Length (m)	Sampling points (N)	Sampling points (N) analysed
Western lowland ML	7602	30	28
Mulele plateau M	7583	30	29
Eastern lowland MI/MJ	7592	30	29
Total	22,777	90	86

The forest parametes determined by the PCQM for both diameter size classes of all transects are given in Table 2 below including tree/shrub density and mean basal area (PCQM and Bitterlich). The mean tree height is derived from the estimated dominant tree

height observed in the field. The standing volume was calculated as product from mean basal area determined by PCQM, mean tree height and a mean conservative tree coefficient of 0.5.

Table 2: Forest parameters for Mulele Hills FR

Location / diameter class (N° points)	Tree/ shrub density/ha	Mean basal area/ha PCQM (m ²)	Mean basal area/ha Bitterlich(m ²)	Dominant / mean tree height (m)	Estimated standing vol./ha (m ³)
Mulele Plateau M $\varnothing \geq 20\text{cm}$ (29)	90.97	9.32	12.86	15.1 / 13	60.6
Mulele Plateau M $\varnothing < 20\text{cm}$ (29)	498.26	3.10		6	9.3
Mulele Lowland West ML $\varnothing \geq 20\text{cm}$ (28)	49.12	5.07	10.80	14.3 / 12	30.4
Mulele Lowland West ML $\varnothing < 20\text{cm}$ (28)	187.11	1.30		6	3.9
Mulele Lowland East MI/J $\varnothing \geq 20\text{cm}$ (29)	107.40	9.40	13.98	15.6 / 13	61.1
Mulele Lowland East MI/J $\varnothing < 20\text{cm}$ (29)	512.17	1.03		6	3.1

The standing volume of western lowland is with 30 m³/ha about half of the stands on Mulele plateau and the eastern lowlands (see Table 2).

The **absolute frequency** of the first five tree/shrub species for both diameter classes for miombo woodlands from the three transects of Mulele Hills FR is presented Table 3:

Table 3: Absolute species frequency in miombo woodlands of Mulele Hills FR

Trees Ø ≥ 20cm		Trees/shrubs Ø < 20cm	
Species	Absolute frequency %	Species	Absolute frequency %
<i>Isoberlina angolensis / tomentosa</i>	3, 50, 28	<i>Diplorhynchus condylocarpon</i>	41, 61, 24
<i>Julbernardia globiflora</i>	48, 4, 28	<i>Erythrophleum africanum</i>	10, 11, 45
<i>Pseudolachnostylis maproun.</i>	3, 32, 31	<i>Pseudolachnostylis maproun.</i>	10, 11, 28
<i>Brachystegia spiciformis / Erythrophleum africanum</i>	28, 11, 17 17, 18, 21	<i>Terminalia sericea</i>	-, 25, 21
		<i>Pterocarpus angolensis</i>	17, 7, 17

The **dominance** values (product of mean basal area and species number per ha) for the first five tree/shrub species for both diameter classes is presented in Table 4 below. Only species occurring in at least two transects were considered. Species not present in one transect got assigned a value one higher than the total number of species.

Table 4: Species dominance in miombo woodlands at Mulele Hills FR

Trees Ø ≥ 20cm		Trees/shrubs Ø < 20cm	
Species	Mean Ranking (3 transects)	Species	Mean Ranking (3 transects)
<i>Julbernardia globiflora</i>	3.0	<i>Diplorhynchus condylocarpon</i>	1.3
<i>Erythrophleum africanum</i>	6.7	<i>Pterocarpus angolensis</i>	6.7
<i>Brachystegia spiciformis</i>	8.0	<i>Erythrophleum africanum</i>	8.3
<i>Pseudolachnostylis maproun.</i>	8.7	<i>Pseudolachnostylis maproun.</i>	10.0
<i>Pericopsis angolensis</i>	10.0	<i>Hymenocardia acida</i>	13.3

The diameter distribution of *Pterocarpus angolensis* and *Julbernardia globiflora* is shown in Figures 6 and 7, respectively.

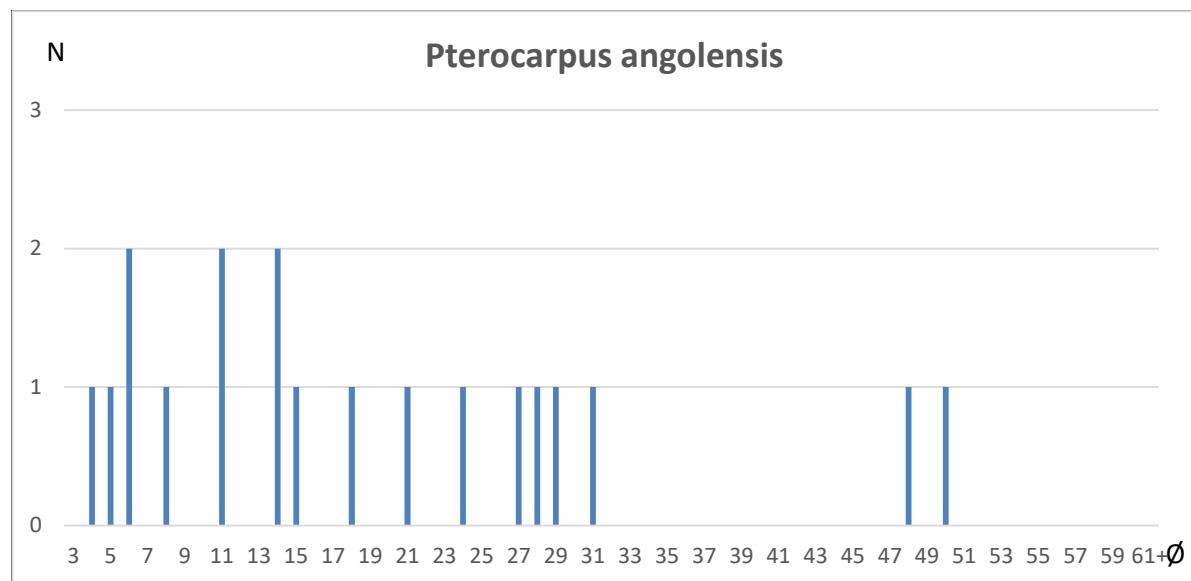

Fig. 6. Diameter distribution of *Pterocarpus angolensis* at Mulele Hills for three transects.

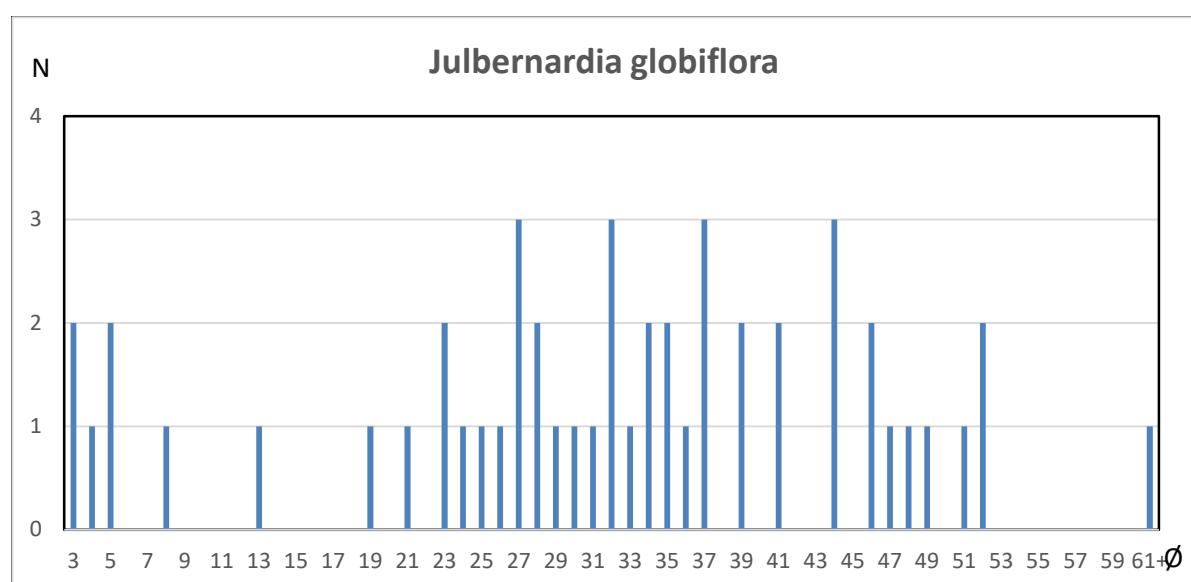

Fig. 7. Diameter distribution of *Julbernardia globiflora* at Mulele Hills for three transects.

The α-diversity for trees and shrubs of miombo woodlands along the three transects is shown in Table 5 below:

Table 5: Alpha-diversity of trees and shrubs of miombo woodlands along the three transects

Transect	$\emptyset \geq 20\text{cm}$	$\emptyset < 20\text{cm}$
Plateau M	27	39
Western lowland ML	27	29
Eastern lowland MI/J	25	40
Total α-diversity	46	70

The checklist for Mlele and Sikonge districts now includes a total of 175 identified trees/shrubs with their scientific and vernacular names and an additional three species only identified with their vernacular names (see Appendix C).

4.2 Human ecosystem disturbances

All human disturbances recorded on a width of 80 m along the transects in Mulele Hills FR are summarised in Table 6 below (not considering tracks and beehives).

Table 6: Human disturbances along the three transects of Mulele Hills Forest Reserve

5) Discussions

Current state of the vegetation

In total 86 sampling points were analysed (see Table 1) including 291 trees of the larger diameter class (≥ 20 cm) and 334 trees/shrubs of the lower diameter class (< 20 cm) considering quarters with no trees (see Table 7).

Table 7: Quarters with no trees

Transect	N quarters with no trees diameter class (≥ 20 cm)	N quarters with no trees diameter class (< 20 cm)
M	13	0
ML	27	8
MI/J	13	2
Total	53	10

Julbernardia globiflora (Muva) a characteristic, widespread and often gregarious tree is dominating in many miombo woodlands including Mlele Beekeeping Zone (Bloesch 2022)

and Kululu Village Land FR and Rungwa River FR (Bloesch 2022). In Mulele Hills FR, Muva is also very abundant on the plateau and the eastern lowlands (see Table 3 and 4). On the hand, *Julbernardia globiflora* is quasi absent in the open and extensively flooded western lowlands. Debarking for making beehives out of the bark is still a serious threat for this species (see chapter human ecosystem disturbances below).

Brachystegia spiciformis, another typical miombo species, is also in Mulele Hills FR a common tree of the upper layer (see Table 3 and 4). This species is increasingly searched for timber since sawable dimensions of traditional timber species like *Pterocarpus angolensis* are becoming very rare. Another abundant species in both layers is *Erythrophleum africanum* (see Table 3 and 4).

The understoreys are widely dominated by *Diplorhynchus condylocarpon* which is easily recognised by the abundant milky latex in its branches. Another very common and small tree is *Pseudolachnostylis maprouneifolia* (see Table 3 and 4).

The genus *Brachystegia* includes now 14 species for the surveyed protected areas (see plant list in Appendix C). However, the identification challenges for several species persist since *Brachystegia* species are thought to hybridise easily with other species from the same genus (Smith & Allen 2004).

Typically, tree diameter distributions of natural forest form a reverse J-shaped or negative exponential curve. This is not the case for *Pterocarpus angolensis* and *Julbernardia globiflora* showing an under-representation of saplings as illustrated in Figures 6 and 7 what is also in line with their diameter distribution from Kululu Village Land FR and Rungwa River FR (Bloesch 2022). Nevertheless, *Pterocarpus angolensis* is amongst the most abundant tree species of the lower diameter class in Mulele Hills FR.

The low abundance of saplings in general is probably typical for miombo woodlands where recurrent fires and browsing suppress the growth of natural regeneration as has been shown for *Pterocarpus angolensis* by Mojeremane & Lumbile (2016). *Pterocarpus angolensis* produces one of the best timbers in East Africa and due to overexploitation mature stems become very rare and is considered as near threatened according to the IUCN Red List. It would be interesting to analyse the diameter class distribution for other timber species which are now increasingly used as timber but our data are too sparse.

The alpha-diversity for trees and shrubs assessed for Mulele Hills FR is with 46 and 70 species in the larger and lower diameter class, respectively, considerably higher than in Kululu Village Land FR (27/47) and Rungwa River FR (29/40). This high biodiversity for Mulele Hills FR is probably due to the diverse landscapes assessed by the three transects.

The vegetation surveys from Mlele Beekeeping Zone (Bloesch 2019), Kululu Village Land FR and Rungwa River FR (Bloesch 2022) and this survey from Mlele Hills FR resulted in a quite comprehensive plant list including a total of 175 trees/shrubs identified with their scientific and vernacular names. Three species could only be identified with their vernacular names (see Appendix C). This plant list will be very useful for any future forest management in the area, the elaboration of a vegetation map, and for the assessment of the importance of the non-timber forest products for the livelihoods of the adjacent local communities.

In addition to the identification of some *Brachystegia* species (see above), the species listed in Table 8 below were so far only identified with their vernacular names.

Table 8: Trees/shrubs to be identified with their scientific names

Vernacular name	Scientific name to be identified/confirmed
Kapondolampassa	<i>Dalbergia boehmii</i>
Mdaa (Msubata)	<i>Euclea schimperi</i>
Kama mponda	<i>Commiphora mollis</i>
Mumwaga	<i>Ochna longipes</i>
Mshenene	<i>Xylopia antunesii</i>
Kama mgunga	<i>Entada abyssinica</i>
Mpilipili	<i>Albizia vesicular / A. antunesiana</i>
Kama mkoma	<i>Grewia</i> sp.
Mgulumwanguku	?
Mlungwanyama	?
Mtandara	?

Moreover, the species identification of the genus *Ochna*, *Monotes africanus* versus *M. katangensis* and *Isoberlinia tomentosa* versus *I. angolensis* need confirmation at Herbarium of the University of Dar es Salaam.

The basal areas determined with PCQM and Bitterlich methods are highly concordant for the plateau transect (see Table 2) what is in line with the transects from Kululu Village Land FR and Rungwa River FR. For the two lowland transects at Mulele Hills FR, the basal area determined by Bitterlich was considerably higher than the values obtain with the PCQM.

Tree density in both diameter classes is significantly lower in the extensively flooded western lowlands. Consequently the total standing volume is with 69.9 m³ and 64.4 m³ on the plateau and eastern lowland, respectively, about twice as high as in the western lowlands. The dense woodlands on the plateau and eastern lowland of Mulele Hills FR have the highest standing volume of all surveyed protected areas.

The extrapolation of the mean forest parameters per hectare to the entire area of each protected areas is not possible since vegetation maps are missing. Detailed vegetation maps showing the different vegetation types and land use in the project areas would be a very useful for management and monitoring purposes. Such maps would also allow the spatial stratification of the project area with well-defined units which could supports other studies in future. For this purpose, the recorded georeferenced vegetation data and photographs could be used for the ground truthing of the digital analysis of the satellite images.

About six to eight sampling points along a transect can be surveyed if access is not a major constraint. The necessary equipment for the transect survey consist of 20m-tape measure, diameter tape measure, compass, camera, GPS and the Bitterlich instrument (metal sheet fixed on a wooden stick of 50 cm length).

Human ecosystem disturbances

Timber logging is the prevailing human ecosystem disturbance. Debarking of *Julbernardia globiflora* for producing beehives is still very common in the eastern woodlands close to Inyonga.

During the rainy season a tall and dense grass layer may hide disturbances along the belt transect. Therefore, it is fundamental to assess disturbances during the dry season where the view is much clearer.

6) Conclusions

The applied transect methodology allows to assess vegetation and disturbances data at once. The plotless PCQM method has the advantage in that it does not require laying out plot boundaries what saves considerable time. It is quite simple to apply but needs an experienced team leader for the proper location of the transect or its relocation in case the transect hits an open area or a major disturbance (e.g. large termitaria) for getting representative data. An additional three to four persons are required, each of them was assigned a specific task. At least one person should have profound knowledge of tree and shrub species (scientific and/or vernacular names).

New team members were trained on-the-spot and have now a good understanding of the different steps of the methodology. For future vegetation transect surveys it is suggested to associate VGSs which are not yet trained and members from the Village Natural Resource Committee to explain them the importance of baseline data and regular monitoring of the state of the forest for management purposes. The human disturbances should be recorded every two years by the VGSs along each transect to monitor the threats for the miombo ecosystems.

The comprehensive vegetation data (especially standing volume) of the miombo woodlands of Kululu Village Land FR, Rungwa River FR and Mulele Hills FR are a solid base for developing and implementing a carbon project.

Vegetation maps are highly needed for the extrapolation of the mean forest parameters per hectare to the entire area of the protected areas and for facilitating management purposes. Since we assume that many human disturbances have been overlooked during the second survey of Kululu Village Land FR and Rungwa River FR in the wet season, the concerned sections of the transects have to be reassessed during the dry season for having reliable data for the planned scientific article on the current state of the miombo woodlands within Rungwa and Katavi – Ugalla corridors.

7) Recommendations

The following recommendations are made to ADAP:

- 1) Instruct the VGS's to collect fresh plant samples (including photographs) for pressing and drying the specimen from not yet scientifically identified species including Kapondolampassa, Mdaa (Msubata), Kama mponda, Mumwaga, Mshenene, Kama mgunga, Mpilipili, Kama mkoma, Mlungwanyama, Mtandara, and Mgulumwanguku. The collected specimen stored in a local herbarium could then be identified with the support of the Herbarium of the University of Dar es Salaam.
- 2) Additional fertile sampling material from *Brachystegia* species such as flowers and fruits are needed for proper identification the different species from this genus. The consultation of the reference herbarium for East Africa at Kew Botanical Garden in London or Meise Botanic Garden in Belgium could help in the exact identification of this difficult genus and other not yet identified species.
- 3) Train all VGS in the transect methodology under the supervision of the livelihood and natural resources officer. An active participation of TFS, DFO and Village Natural Resource Committee is highly recommended. The human disturbances should be recorded every two years by the VGSs along each transect to monitor the threats for the miombo ecosystems.

- 4) Apply for a research permit for publishing the findings from the three vegetation surveys. The focus of the article should be on the presentation of the transect methodology based on the PCQM and its high potential for rapidly monitoring and evaluating the state of the vegetation and the human ecosystem disturbances.
- 5) Design a concept for elaborating a vegetation map for Mlele and Sikonge districts including TFS and DFOs. The comprehensive data set and the photographs from the sampling points of all surveys could be used as ground truth for elaborating the map. This study could be conducted jointly by Swiss and Tanzanian BSc/MSc students and should be budgeted for the next project phase.
- 6) Reassess the human disturbances in Kululu Village Land FR and Rungwa River FR in the dry season since the second survey has been realised during the rainy season in January / February 2021 (Bloesch 2022). We assume that many human disturbances could not be detected at that time due to dense vegetation and in particular high grasses. We expect a workload of one day per transect (five transects, only one, RT1, was fully surveyed in the dry season).

Appendix A: Mission Programme

Date	Programme
26/6/2021	Train trip from Evilard to Zurich
27/6/2021	Flight Zurich – Amsterdam – Dar es Salaam
28/6/2021	Dar es Salaam
29/6/2021	Flight Dar es Salaam – Tabora; preparation TFS workshop
30/6/2021	TFS Workshop in Tabora and demonstration of PCQM at Puge Simbo FR
1/7/2021	Travelling by car Tabora – Inyonga; briefing project team; preparation field survey
2/7/2021	Briefings immigration service and TFS Mlele District; travelling by car to the Ranger Training Center at Mulele Hills FR (campsite)
3-5/7/2021	Transect M near Ranger Training Center
6/7/2021	Riverine forest at Iloba waterfall near Ranger Training Center; transect ML (lowland)
7/7/2021	Transect ML (lowland); travelling back to Inyonga
8-11/7/2021	Transect MI (eastern part of Mulele Hills FR); travelling by car Inyonga – Tabora
12/7/2021	Debriefing TFS with Thomas Wambura (acting TFS zonal manager western Tanzania); discussion with Valentine Msusa former TFS zonal manager western Tanzania
13/7/2021	Flight Tabora – Dar es Salaam
14/7/2021	Flight Dar es Salaam – Amsterdam
15/7/2021	Flight Dar es Salaam – Amsterdam – Zurich; train trip from Zurich to Evilard

Appendix B: Vegetation transects in Mulele Hills Forest Reserve

Transect M: Mulele Plateau near Training Center

Starting point about 100 m north of the road; direction azimuth: 0°/360°

Sampling point 1 (3/7/21):

Coordinates: S 6.67329 / E 31.62073

Slope: 1-2%, slope exposure: 250°

Dominant tree height: 17 m

Basal area (Bitterlich, k=1): 10.5 m²

Photos: 7922, 7923, 7924, 7925

Disturbances/notes (1-2): 1 *Pterocarpus angolensis* cut 2021, BDH: 40 cm; 2 *Monotes africanus / katangensis* were cut for allowing the felling of Mninya (140 steps); foot path (192 steps)

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	No tree		
	<i>Lannea schimperi</i>	36	12.00
	<i>Julbernardia globiflora</i>	51	7.90
	<i>Pterocarpus angolensis</i>	48	3.40
DBH < 20 cm	<i>Oldfieldia dactylophylla</i>	14	7.45
	<i>Diplorhynchus condylocarpon</i>	10	6.90
	<i>Diplorhynchus condylocarpon</i>	13	5.50
	<i>Lonchocarpus capassa</i>	6	8.00

Sampling point 2 (3/7/21):

Coordinates: S 6.67096 / E 31.62040

Slope: 1-2%, slope exposure: 240°

Dominant tree height: 16 m

Basal area (Bitterlich, k=1): 14 m²

Photos: 7930, 7931, 7932, 7933

Disturbances/notes (2-3): Beehive (8 steps)

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	No tree		
	<i>Sclerocarya birrea</i>	59	7.80
	<i>Brachystegia spiciformis</i>	26	6.35
	<i>Brachystegia spiciformis</i>	22	4.50
DBH < 20 cm	<i>Brachystegia stipulata</i>	11	1.50
	<i>Dichrostachys cinerea</i>	11	4.80
	<i>Dichrostachys cinerea</i>	6	2.60
	<i>Rhus longipes</i>	6	1.45

Sampling point 3 (3/7/21):

Coordinates: S 6.66863 / E 31.62019

Slope: +/- 1%

Dominant tree height: 16 m

Basal area (Bitterlich, k=1): 12.5 m²

Photos: 7934, 7935, 7936, 7937

Disturbances/notes (3-4): track (35 steps)

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Brachystegia spiciformis</i>	20	6.15
	<i>Brachystegia spiciformis</i>	20	6.05
	<i>Brachystegia spiciformis</i>	20	10.70
	<i>Stereospermum kunthianum</i>	23	3.15
DBH < 20 cm	<i>Hexalobus monopetalus</i>	6	5.70

	<i>Brachystegia spiciformis</i>	10	6.60
	<i>Brachystegia glaucescens</i>	8	3.40
	<i>Diplorhynchus condylocarpon</i>	13	3.40

Sampling point 4 (3/7/21):

Coordinates: S 6.66617 / E 31.62023

Slope: +/- flat, slope exposure: 250°

Dominant tree height: 17 m

Basal area (Bitterlich, k=1): 16 m²

Photos: 7938, 7939, 7940, 7941

Disturbances/notes (4-5): 1 *Pterocarpus angolensis* cut (10 years), 1 beehive (120 steps); 5

Pterocarpus angolensis freshly cut and several old *Pterocarpus angolensis* logs (5 years) (140 steps); 4 *Pterocarpus angolensis* cut (5 years) (220 steps)

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Julbernardia globiflora</i>	37	4.70
	<i>Combretum collinum</i>	23	5.45
	<i>Pericopsis angolensis</i>	81	17.40
	<i>Julbernardia globiflora</i>	62	6.15
DBH < 20 cm	<i>Strychnos spinosa</i>	3	2.80
	<i>Combretum zeyheri</i>	10	4.30
	<i>Diplorhynchus condylocarpon</i>	8	2.70
	<i>Diplorhynchus condylocarpon</i>	8	1.90

Sampling point 5 (3/7/21):

Coordinates: S 6.66338 / E 31.62018

Slope: - 1%, slope exposure: 240°

Dominant tree height: 16 m

Basal area (Bitterlich, k=1): 13 m²

Photos: 7945, 7946, 7947, 7948

Disturbances/notes (5-6): 2 m from track; 1 *Pterocarpus angolensis* cut (5 years) (30 steps); 4

Pterocarpus tinctorius cut (5 years) (150 steps); saw pit (280 steps)

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Brachystegia spiciformis</i>	28	12.30
	<i>Pericopsis angolensis</i>	39	3.70
	<i>Pericopsis angolensis</i>	26	5.95
	<i>Julbernardia globiflora</i>	33	14.70
DBH < 20 cm	<i>Diplorhynchus condylocarpon</i>	13	17.50
	<i>Anisophyllea boehmii</i>	14	9.85
	<i>Pericopsis angolensis</i>	18	5.90
	<i>Uapaca kirkiana</i>	5	17.30

Sampling point 6 (3/7/21):

Coordinates: S 6.66073 / E 31.62014

Slope: 0-1%, slope exposure: 180°

Dominant tree height: 16 m

Basal area (Bitterlich, k=1): 14.5 m²

Photos: 7949, 7950, 7951, 7952

Disturbances/notes (6-7): -

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	No tree		
	<i>Monotes africanus / katangensis</i>	37	8.20
	<i>Monotes africanus / katangensis</i>	28	7.30
	<i>Brachystegia spiciformis</i>	39	10.80

DBH < 20 cm	<i>Brachystegia stipulata</i>	4	1.20
	<i>Uapaca kirkiana</i>	17	2.50
	<i>Brachystegia stipulata</i>	8	1.20
	<i>Pterocarpus angolensis</i>	8	7.60

Sampling point 7 (4/7/21):

Coordinates: S 6.65827 / E 31.62028

Slope: 0-1%, slope exposure: 200°

Dominant tree height: 14 (16) m

Basal area (Bitterlich, k=1): 15.5 m²

Photos: 7953, 7954, 7955, 7956

Disturbances/notes (7-8): -

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Pterocarpus angolensis</i>	27	2.70
	<i>Uapaca kirkiana</i>	29	7.40
	<i>Uapaca kirkiana</i>	26	9.80
	<i>Monotes africanus / katangensis</i>	27	16.90
DBH < 20 cm	<i>Julbernardia globiflora</i>	8	2.75
	<i>Brachystegia longifolia</i>	18	4.40
	<i>Uapaca kirkiana</i>	8	0.80
	<i>Uapaca kirkiana</i>	11	1.20

Sampling point 8 (4/7/21):

Coordinates: S 6.65586 / E 31.62022

Slope: 0-1%, slope exposure: 200°

Dominant tree height: 16 (18) m

Basal area (Bitterlich, k=1): 11.5 m²

Photos: 7957, 7958, 7959, 7960

Disturbances/notes (8-9): 2 *Pterocarpus tinctorius* cut (5 years) (200 steps);

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Anisophyllea boehmii</i>	34	14.95
	<i>Monotes africanus / katangensis</i>	31	3.20
	<i>Julbernardia globiflora</i>	37	19.90
	<i>Parinari curatellifolia</i>	49	1.60
DBH < 20 cm	<i>Brachystegia spiciformis</i>	6	0.60
	<i>Vitex doniana</i>	4	1.20
	<i>Erythrophleum africanum</i>	9	3.95
	<i>Cassipourea mollis</i>	4	10.05

Sampling point 9 (4/7/21):

Coordinates: S 6.65345 / E 31.62018

Slope: +/- flat

Dominant tree height: 12 (17) m

Basal area (Bitterlich, k=1): 5.5 m²

Photos: 7961, 7962, 7963, 7964

Disturbances/notes (9-10): -

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	No tree		
	<i>Pterocarpus angolensis</i>	24	4.80
	<i>Brachystegia floribunda</i>	44	6.80
	<i>Parinari curatellifolia</i>	42	17.60
DBH < 20 cm	<i>Diplorhynchus condylocarpon</i>	6	3.00
	<i>Uapaca kirkiana</i>	17	7.30

	<i>Phyllocosmus leimareanus</i>	5	4.70
	<i>Parinari curatellifolia</i>	5	7.70

Sampling point 10 (4/7/21):

Coordinates: S 6.65112 / E 31.62024

Slope: 0-1%, slope exposure: 250°

Dominant tree height: 15 m

Basal area (Bitterlich, k=1): 12 m²

Photos: 7965, 7966, 7967, 7968

Disturbances/notes (10-11): -

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Borassus aethiopum</i>	40	10.95
	No tree		
	<i>Brachystegia floribunda</i>	62	20.00
	<i>Brachystegia longifolia</i>	35	5.50
DBH < 20 cm	<i>Brachystegia floribunda</i>	5	1.60
	<i>Julbernardia globiflora</i>	5	1.75
	<i>Julbernardia globiflora</i>	5	2.45
	<i>Julbernardia globiflora</i>	3	2.70

Sampling point 11 (4/7/21):

Coordinates: S 6.64891 / E 31.62013

Slope: 0-1%, slope exposure: 360°

Dominant tree height: 18 m

Basal area (Bitterlich, k=1): 15 m²

Photos: 7969, 7970, 7971, 7972

Disturbances/notes (11-12): -

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Julbernardia globiflora</i>	26	3.80
	<i>Brachystegia floribunda</i>	49	7.60
	<i>Brachystegia floribunda</i>	36	8.65
	<i>Brachystegia floribunda</i>	31	3.00
DBH < 20 cm	<i>Diplorhynchus condylocarpon</i>	9	7.90
	<i>Dalbergia nitidula</i>	10	4.25
	<i>Diplorhynchus condylocarpon</i>	8	14.75
	<i>Diplorhynchus condylocarpon</i>	7	4.70

Sampling point 12 (5/7/21):

Coordinates: S 6.64638 / E 31.62024

Slope: +/- flat

Dominant tree height: 16 m

Basal area (Bitterlich, k=1): 13 m²

Photos: 7973, 7974, 7975, 7976

Disturbances/notes (12-13): -

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Julbernardia globiflora</i>	44	10.30
	<i>Brachystegia floribunda</i>	70	14.80
	<i>Julbernardia globiflora</i>	31	13.75
	<i>Brachystegia floribunda</i>	30	17.80
DBH < 20 cm	<i>Brachystegia glaucecens</i>	6	1.10
	<i>Pterocarpus angolensis</i>	11	2.85
	<i>Pterocarpus angolensis</i>	14	4.80
	<i>Cassipourea mollis</i>	4	6.50

Sampling point 13 (5/7/21):

Coordinates: S 6.64375 / E 31.62025

Slope: 0-1%, slope exposure: 330°

Dominant tree height: 16 m

Basal area (Bitterlich, k=1): 12.5 m²

Photos: 7977, 7978, 7979, 7980

Disturbances/notes (13-14): around 10 sticks of *Julbernardia globiflora* cut 2021 for ropes; beehives hanging in the trees (70 steps)

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Julbernardia globiflora</i>	47	9.10
	<i>Brachystegia floribunda</i>	43	17.10
	<i>Julbernardia globiflora</i>	32	16.15
	<i>Julbernardia globiflora</i>	36	13.70
DBH < 20 cm	<i>Parinari curatellifolia</i>	3	17.95
	<i>Combretum molle</i>	7	1.95
	<i>Brachystegia glaucescens</i>	4	2.65
	<i>Markhamia obtusifolia</i>	6	4.70

Sampling point 14 (5/7/21):

Coordinates: S 6.64025 / E 31.62047

Disturbances/notes: Mbuga, not surveyed

Sampling point 15 (5/7/21):

Coordinates: S 6.64011 / E 31.61919; parallel location of the transect at 100m?

Slope: 1%, slope exposure: 340°

Dominant tree height: 13.5 m

Basal area (Bitterlich, k=1): 18 m²

Photos: 7981, 7982, 7983, 7984

Disturbances/notes (15-16):

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Phyllocosmus leimareanus</i>	24	1.95
	<i>Pericopsis angolensis</i>	41	14.00
	<i>Pericopsis angolensis</i>	32	9.55
	<i>Phyllocosmus leimareanus</i>	24	5.35
DBH < 20 cm	<i>Phyllocosmus leimareanus</i>	9	2.05
	<i>Hymenocardia acida</i>	6	7.25
	<i>Hymenocardia acida</i>	10	3.05
	<i>Cassipourea mollis</i>	9	2.30

Sampling point 16 (5/7/21):

Coordinates: S 6.63747 / E 31.61904

Slope: 1%, slope exposure: 290°

Dominant tree height: 16 m

Basal area (Bitterlich, k=1): 19 m²

Photos: 7985, 7986, 7987, 7988

Disturbances/notes (16-17): Sampling point on the edge of mbuga

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Brachystegia longifolia</i>	24	10.20
	<i>Brachystegia longifolia</i>	62	19.95
	No tree		
	<i>Brachystegia longifolia</i>	20	6.30

Appendix C: Tree and shrub checklist for Mlele and Sikonge districts (12/5/2023)

Scientific name	Kikonongo / Kinyamwezi	Uses, ecology, other characteristics
<i>Acacia drepanolobium</i> (<i>Vacchellia d.</i>)		
<i>Acacia gerrardii</i> (<i>Vacchellia g.</i>)	Ulula	
<i>Acacia nilotica</i> (<i>Vacchellia n.</i>)		
<i>Acacia polyacantha</i> (<i>Vacchellia p.</i>)	Muwombwe	
<i>Acacia stuhlmannii</i> (<i>Vacchellia s.</i>)	Nunga?	
<i>Acacia tanganyikensis</i> (<i>Vacchellia t.</i>)	Mzima?	
<i>Acacia sieberiana</i> (<i>Vacchellia s.</i>)		
<i>Acacia tortilis</i> (<i>Vacchellia t.</i>)		
<i>Acacia xanthophloea</i> (<i>Vacchellia x.</i>)		
<i>Afzelia quanzensis</i>	Mkola	Timber
<i>Albizia amara</i>	Mpogolo,	Leaflets straight
<i>Albizia antunesiana</i>	Mpilipili	Timber
<i>Albizia glaberrima</i>		
<i>Albizia grandibracteata</i>		
<i>Albizia gummosa</i>		
<i>Albizia harveyi</i>	Mpogolo, Mkologomgoe	Leaflets sickle-shaped
<i>Albizia versicolor</i>	Masako, Mpilipili	
<i>Anisophyllea boehmii</i>	Msindwi	
<i>Anisophyllea pomifera?</i>		No hairy leaves
<i>Annona senegalensis</i>	Mfilafila	Fruit edible
<i>Antidesma membranaceum</i>	Msekela	Fruit edible
<i>Antidesma venosum</i>	Msekela	Fruit edible
<i>Azanza garckeana</i>	Mtowo	
<i>Bauhinia petersiana</i>	Mfundwa mbogo	
<i>Bauhinia thonningii</i>	Mfundwa mbogo	
<i>Bobgunnia madagascariensis</i>	Kasanda	Timber
<i>Borassus aethiopum</i>	Sandala	Fruit edible
<i>Brachystegia boehmii</i>		Slashed bark reddish; large tree trunk
<i>Brachystegia bussei</i>	Mkongolo	Tall tree on rocky hillsides; slashed bark reddish
<i>Brachystegia floribunda</i>	Myusa/Musa dumbe	Slashed bark reddish
<i>Brachystegia glaberrima</i>	Msilanga	Initially identified mistakenly as <i>Brachystegia utilis/floribunda</i> ; slashed bark reddish

<i>Brachystegia glaucescens</i>	Myombo	Slashed bark reddish
<i>Brachystegia longifolia</i>	Msilanga	Slashed bark reddish
<i>Brachystegia manga</i>		Recorded by Fredy Masanja; slashed bark reddish
<i>Brachystegia microphylla</i>	Mkongolo	Slashed bark reddish
<i>Brachystegia spiciformis</i>	Mtundu / Umtundu	Timber; slashed bark reddish
<i>Brachystegia stipulata</i>	Msilanga	Slashed bark reddish
<i>Brachystegia cf. stipulata</i>	Myusa/Musa jike	High tree (18m); bark for beehives; slashed bark reddish
<i>Brachystegia taxifolia</i>	Kapepe	slashed bark reddish
<i>Brachystegia utilis</i>	Msilanga	Slashed bark reddish
<i>Brachystegia wangermeeana</i>		Fred western lowland; slashed bark reddish
<i>Bridelia atroviridis</i>		
<i>Bridelia cathartica</i>		
<i>Bridelia duvigneaudii</i>		
<i>Bridelia scleroneura</i>		
<i>Burkea africana</i>	Mgandosinsi	
<i>Cassia abbreviata</i>	Mlundalunda	
<i>Cassia singueana</i>	Mzokazoka	
<i>Cassipourea mollis</i>	Mlugala	
<i>Catunaregam spinosa</i>	Mpongole	
<i>Chrysophyllum bangweolense</i>		
<i>Combretum collinum</i>	Mlandala	
<i>Combretum fragrans (C. adenogonium)</i>	Mlozyaminze / Mluziaminzi	Leaf underside veloutinous
<i>Combretum molle</i>	Mlama	
<i>Combretum zeyheri</i>	Msana	Shiny leaf surface
<i>Commiphora africana</i>	Mponda	
<i>Commiphora mollis</i>	Kama mponda	
<i>Commiphora mosambicensis</i>		
<i>Craibia brevicaudata</i>		Riverine Forest, Iloba waterfall near Training Centre Mulele Hills FR
<i>Crossopteryx febrifuga</i>	Msanza	
<i>Dalbergia boehmii</i>	Kapondolampassa	
<i>Dalbergia melanoxylon</i>	Mgembe (Swahili Mpingo)	Ebony, carving
<i>Dalbergia nitidula</i>	Kapondalampassa	
<i>Deinbollia borbonica</i>		Riverine Forest, Iloba waterfall near Training Centre Mulele Hills FR
<i>Dichrostachys cinerea</i>	Kasunzulu	
<i>Diospyros cornii</i>	Mnumbulu	

<i>Diospyros kirkii</i>		
<i>Diospyros mespiliformis</i>	Msinde	Riverine forest; fruit edible
<i>Diospyros</i> sp.		Riverine Forest, waterfall Iloba River near Training Centre Mulele Hills FR
<i>Diplorhynchus condylocarpon</i>	Msonga	
<i>Dombeya rotundifolia</i>	Mlalila	
<i>Dracaena reflexa</i>	Kapupwa	Roots used as remedy for snake bites
<i>Ekebergia capensis</i>	Mtuzya	
<i>Elaeodendron schweinfurthianum</i>		
<i>Entada abyssinica</i>	Mfutwamvula / Kamchicha / Kama mgunga	
<i>Eriosema</i> sp.		
<i>Erythrina abyssinica</i>	Kamchicha	
<i>Erythrophleum africanum</i>	Mgandongoye	
<i>Euclea schimperi?</i>	Mdaa / Msubata	
<i>Euphorbia candelabrum</i>	Mlangale	Drier areas
<i>Euphorbia dendroides</i>		
<i>Euphorbia matabelensis</i>	Kiponda	
<i>Faidherbia albida</i>		
<i>Ficus</i> sp.		Riverine Forest, Iloba waterfall, near Training Centre Mulele Hills FR
<i>Ficus glomosa</i>		
<i>Ficus stuhlmannii</i>		Medium sized strangler (ML12)
<i>Flacourzia indica</i>	Msungu, Msingira	Fruit edible
<i>Flueggea virosa</i>	Kisenga	Syn.: Securinega virosa; fruit edible
<i>Friesodielsia obovata</i>	Msalansi	Fruit edible
<i>Garcinia huillensis</i>	Myeye	Fruit edible
<i>Grewia bicolor</i>	Mkoma	Fruit edible
<i>Grewia</i> sp. ?	Kama mkoma	
<i>Hexalobus monopetalus</i>	Mkuwa	Fruit edible
<i>Holarrhena pubescens</i>	Msongalukuga	Syn.: H. febrifuga
<i>Hymenocardia acida</i>	Kapala, Msanza	
<i>Isoberlinia angolensis</i>	Mnembela	
<i>Isoberlinia tomentosa</i>		
<i>Julbernardia globiflora</i>	Muva	Bark for beehives; slashed bark yellowish
<i>Kigelia africana</i>	Mdungwa	
<i>Lannea schimperi</i>	Mgumbu, Mgugumbuga?	Fruit edible
<i>Lannea discolor</i>		Fruit edible

<i>Lonchocarpus capassa</i> (<i>Philenoptera violacea</i>)	Mvalevale	
<i>Lonchocarpus eriocalyx</i>		
<i>Margaritaria discoidea</i>		Syn. <i>Phyllanthus discoideus</i>
<i>Manilkara mochisia</i>	Mkonze	Riverine forest; fruit edible
<i>Maprounea africana</i>		Fruit edible
<i>Maranthes floribunda</i>	Mwasha	
<i>Markhamia obtusifolia</i>	Mpapa	
<i>Maytenus senegalensis</i>	Mwesia	
<i>Memecylon flavovirens</i>	Mseweye	Fruit edible
<i>Monanthotaxis discolor</i>	Mshenene	
<i>Monotes africanus</i>	Mkokote	
<i>Monotes katangensis</i>	Mukokoti	
<i>Multidentia crassa</i>	Mukukumba	Fruit edible
<i>Mundulea sericea</i>		
<i>Mystroxylon aethiopicum</i>	Kasela	
<i>Ochna afzelii</i> ssp. <i>afzelii</i>		
<i>Ochna inermis</i>		
<i>Ochna longipes</i>	Mumwaga, Mnyege	Syn.: <i>O. holstii</i>
<i>Ochna macrocalyx</i>	Mwaga	
<i>Ochna oxyphylla</i>		
<i>Olax obtusifolia</i>	Mtundwa	
<i>Oldfieldia dactylophylla</i>	Mliwamfwengi	Fruit edible
<i>Ozoroa insignis</i> subsp. <i>reticulata</i>	Mkalakala (Swahili: Mwembepoli)	
<i>Parinari curatellifolia</i>	Mbula/Mhula	Fruit edible
<i>Pavetta stuhlmannii</i>		
<i>Pericopsis angolensis</i>	Mbanga	Timber
<i>Phyllanthus engleri</i>	Mng'ongomtandala	
<i>Phyllocosmus leimareanus</i>	Msonifya	
<i>Pleurostylia africana</i>		
Premna sp.		
<i>Protea madiensis</i>		
<i>Pseudolachnostylis maprouneifolia</i>	Mtungulu	
<i>Psorospermum febrifugum</i>	Mvivi	Fruit edible
<i>Psychotria eminiana</i>		
<i>Pterocarpus angolensis</i>	Mninga	Timber
<i>Pterocarpus tinctorius</i>	Mkulungu	Timber
<i>Rhus longipes</i>	Msilanswagalo	

<i>Rhus vulgaris</i>	Kankiningi	
<i>Rytigynia decussata</i>		
<i>Rytigynia uhliglii</i>	Msongwansimba	
<i>Rothmannia engleriana</i>	Mlozilozi, Mukondokondo	Fruit edible
<i>Schrebera trichoclada</i>	Mputika	
<i>Sclerocarya birrea</i>	Mng'ongo	Fruit edible
<i>Securidaca longepedunculata</i>	Mteywe	
<i>Sterculia africana</i>	Msawala	
<i>Sterculia quinqueloba</i>	Mkungulanga / Msavala / Msawala	
<i>Stereospermum kunthianum</i>	Mwogawami	
<i>Strychnos innocua</i>	Mkulwa	Fruit edible
<i>Strychnos potatorum</i>	Mnyekenyewe, Mwegwe	
<i>Strychnos pungens</i>	Mkome?	Fruit edible
<i>Strychnos spinosa</i>	Katonga, Mwaye	Fruit edible
<i>Syzygium guineense</i> subsp. <i>guineense</i>	Kashamongo	Riverine forest; fruit edible
<i>Tapiphylum discolor</i>		
<i>Tamarindus indica</i>	Msisi (Swahili: Mkwaju)	Fruit edible (juice)
<i>Terminalia sericea</i> (<i>T. kaiseriana</i>)	Kazima	
<i>Terminalia mollis</i>	Mfufu	Very large leaves
<i>Terminalia torulosa</i>	Mkelenge	Reddish seeds
<i>Trichilia emetica</i>	Mkalya	
<i>Uapaca kirkiana</i>	Mkusu	Fruit edible
<i>Uapaca nitida</i>	Mkokofinyo	Fruit edible
<i>Vangueria madagascariensis</i>	Mgelelya	Fruit edible
<i>Vangueriopsis lanciflora</i>	Mgelelya	Fruit edible
<i>Vitex doniana</i>	Mfulu, Mfululegea	Fruit edible
<i>Vitex fischeri?</i>		
<i>Vitex madiensis</i>	Mfululegea	Fruit edible; leaves like sandpaper
<i>Vitex mombassae</i>	Mtalali	Fruit edible
<i>Vitex payos</i>	Mtalali	Fruit edible
<i>Xeroderris stuhlmannii</i>		
<i>Ximenia americana?</i>	Mtundwa	Fruit edible
<i>Ximenia caffra</i>	Kaguvaguva	Fruit edible
<i>Xylopia antunesii</i>	Mshenene	Monanthotaxis discolour?
<i>Zantha africana</i>		
<i>Zanthoxylum chalybeum</i>	Mlungulungu	
<i>Ziziphus mucronata</i>	Kagaole	Fruit edible

	Mgulumwanguku (M24)	
	Mlungwanyama (RT3: 2)	
	Mtandara (RT3: 2)	
Total number of species identified with their latin name: 175	Total number of species identified only with their vernacular names: 3	

Appendix D: Location of the three transects in Mulele Hills Forest Reserve
